All users can create, send and **share custom artwork** using Telegram's **open platform** for stickers and emoji. The built-in Sticker Editor lets everyday users **seamlessly create** stickers in the Telegram app **with their own photos** to share in chats.

Artists and content creators can make vector animations, video files and static images in their **preferred apps** – then upload them with the @Stickers mini app to share their artwork with **over 1 billion** users.

Creating Stickers in Telegram

Any Telegram user can create **custom stickers** in any Telegram chat – transforming photos into **creative artwork** that can be saved and shared everywhere.

In-App Sticker Maker

You can quickly turn **any photo** on your device into a **custom sticker** with added **text**, **drawings**, **emoji** and more using the built-in Sticker Editor. This allows anyone to easily make their own stickers **without special software** – right in the chat.

The sticker editor also allows you to **create packs** of custom stickers to share with friends and family.

> To access the Sticker Editor, open the sticker panel from your input field in any chat and tap

> the (+) button.

@Stickers Mini App

The @Stickers allows anyone to **create and manage packs** of both stickers and emoji, **access detailed usage statistics** and more – all from one intuitive interface.

> The functions of the @Stickers bot can also be accessed via **text commands**.

Creating Stickers with Software

Artists and content creators can make stickers in **multiple formats** using their **preferred editing apps** – and upload the final animation, video or image files as both **stickers and emoji**.

Animated Stickers and Emoji

Telegram stickers and emoji can move with smooth **60 FPS animations** to bring your characters to life in high resolution.

> Animations require Telegram's unique **.TGS format** – click here for **Video Stickers and Emoji** made in **.WEBM format**.

Creating Animations

To create vector-animated stickers and emoji you will need the following:

1. Any vector graphics editor that allows exporting vector objects to Adobe After Effects to turn them into animations.
2. Adobe After Effects.
3. The Bodymovin-TG plugin, a fork of Bodymovin for Adobe After Effects that can be used to export animations to Telegram's **.TGS format**.

> The Lottie-based .TGS format allows for incredibly detailed animations that are **less than 30 KB** in size – six times smaller than the average photo.

Animation Requirements

- The canvas size must be **512x512 pixels**.
- Objects must not leave the canvas.
- Animation length must not exceed **3 seconds**.
- All animations must be looped.

- Final file size must not exceed **64 KB** after rendering in Bodymovin.
- All animations must run at **60 Frames Per Second**.
- You **must not** use the following Adobe After Effects functionality when animating your artwork: *Auto-bezier keys, Expressions, Masks, Layer Effects, Images, Solids, Texts, 3D Layers, Merge Paths, Star Shapes, Gradient Strokes, Repeaters, Time Stretching, Time Remapping, Auto-Oriented Layers*.

Video Stickers and Emoji

Stickers and emoji can also be built with **.WEBM** – an open-source format that is compatible with many graphics editors to create high-detail images. Requires Telegram 8.5 or higher.

Creating Videos

To create stickers and emoji from video files, you only need editing software that lets you export your project as a **.WEBM video file**.

Video Requirements

> See this Encoding .WEBM with VP9 Guide for details

- For stickers, one side must be exactly **512 pixels** in size – the other side can be 512 pixels **or less**.
- For emoji, the video must be exactly **100x100 pixels** in size
- Video duration must not exceed **3 seconds**.
- Frame rate can be up to **30 FPS**.
- Video should be looped for optimal user experience.
- Video size should not exceed **256 KB**.
- Video must be in .WEBM format encoded with the **VP9 codec**.
- Video must have **no audio stream**.

Static Stickers and Emoji

Turn your favorite drawings and memes into packs of images that are easily to share and access on any device.

Creating Images

To create static stickers and emoji for Telegram, you only need an image editor that lets you export in **.PNG** or **.WEBP** format.

Image Requirements

- For stickers, one side must be exactly **512 pixels** in size – the other side can be 512 pixels **or less**.

- For emoji, images must be exactly **100x100 pixels** in size.
- The image file must be in either .PNG or .WEBP format.

> Tip: a transparent background, white stroke and black shadow effect will make your sticker stand out.

Custom Emoji

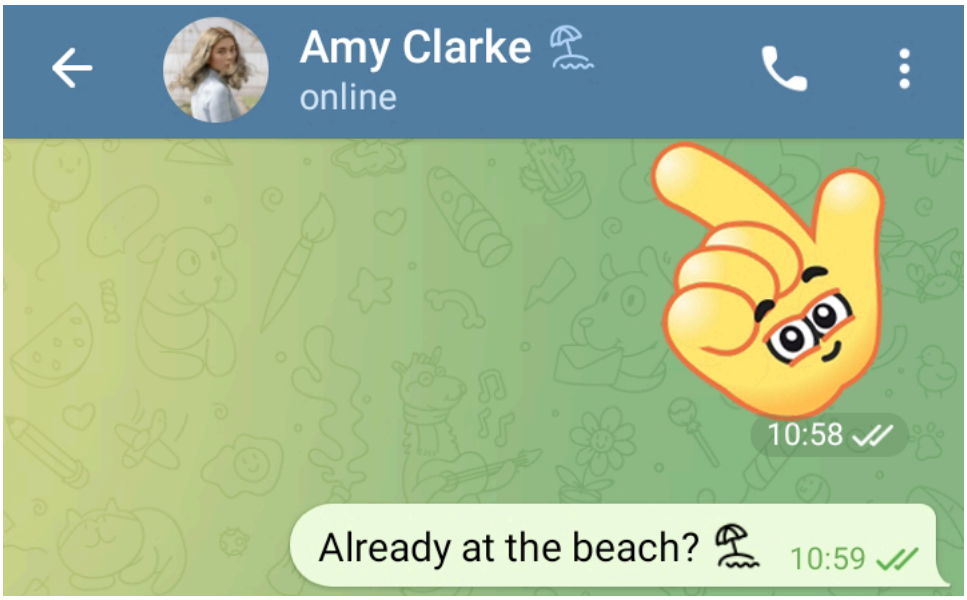

As of version 8.9 released in August 2022, Telegram apps support custom emoji.
Emoji use the same technology as stickers, making it very easy to convert your art to **both formats**. Check out the video and image sections for details on the different size requirements.

> Everyone can create new custom emoji, however, adding and using custom sets is currently an exclusive feature of Telegram Premium users.

Adaptive Emoji

If you intend to create a set of **simple icons** with **solid colors** that change their color based on where they are used, you can send the command `/adaptive` when creating your emoji set.

When used as emoji statuses and topic icons, such emoji will match the **accent color** of the user's theme. When in a message, they will match the **text color** in that message.

Importing Stickers From Other Apps

Developers can build apps to automate importing stickers using Telegram's API. With these tools, users can instantly bring their favorite stickers to Telegram.

For Users

Users can find apps that allow them to import stickers or quickly **generate their own**. They can also easily publish custom stickers with the @Stickers bot using .PNG, .WEBP or .WEBM files for stickers from other apps.

For Developers

As of version 7.8, Telegram apps support a simple API for importing stickers. Developers can use this to **build apps** or **add tools** to apps that let users instantly transfer stickers to Telegram – or create custom stickers from photos or videos.

> Click here for more information about developing apps for importing stickers.
